

Treatment of the Stiff Knee

Ph Neyret
H Yercan
E Servien
S Lustig

University of Lyon

Classification

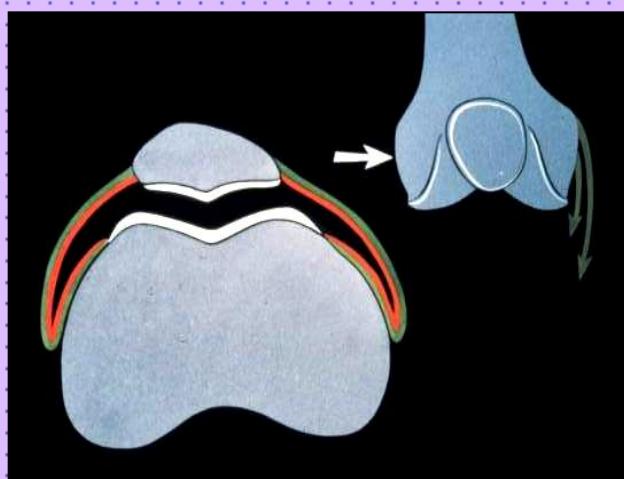

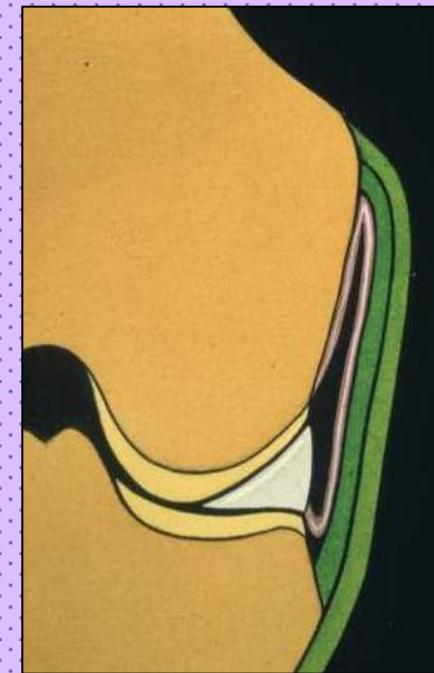

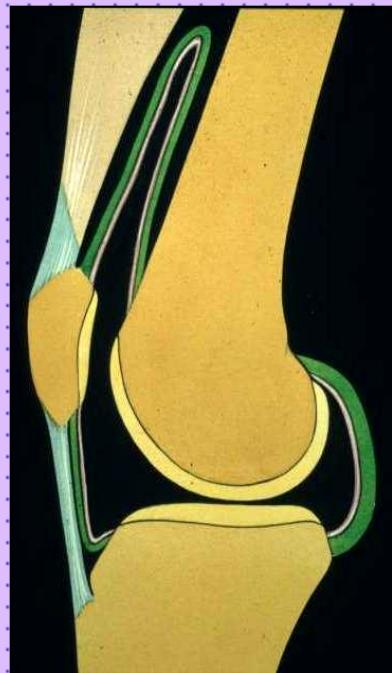

According to

- + Anatomy
- + Range of Motion
- + Etiology
- + Timing

Classification

⊕ Anatomy

- ❖ Articular
 - the cavity (adherences, prosthesis)
 - the capsule (patellar tendon)
- ❖ Extra-Articular (muscle)

Articular

Extra articular

Classification

⊕ Range of Motion

❖ Clinical examination

Stiffness after TKA: 10-90

TKA on stiff knee: 30-60

❖ Dynamic evaluation: $< 5^\circ$ / week

Classification

- ❖ Etiology

RSD

Infection

- ❖ NON Prosthesis dependant

Pre op: Multiple surgery, Hip

Post op: Rehabilitation and Pain

- ❖ Prosthesis dependant

Design and Size

Constraint: Pcl R, Bicruciate R

Positioning: Gap

Classification

- ❖ Timing or Duration of symptoms
 - ❖ Per-op stiffness
 - ❖ Post-op stiffness
 - Early Stiff TKA < D 45
 - Late D 45 < stiff TKA < 6 months
 - Chronic after 6 months

Our series: 1188 Primary TKA

From 1987 to 2004 Mean FU: 31 (3-122)

Posterior stabilized HLS-Noetos

n=63 (F:49, M:14)

5.3%

Infection and RSD were ruled out and excluded

1. Manipulation under anaesthesia 46
2. Arthroscopic release 3
3. Open arthrolysis 5
4. Component revision 2

N= 56

PreTKA ROM : 113° (50-140)

During TKA : 122° (min 110°), no flexum

1. Manipulation under Anaesthesia

- ◆ N=46
- ◆ Time between TKA and MUA 30 days (10-90)

	During TKA	Before MUA	During MUA	At FU
ROM	122 +/- 5	67 +/- 11	117 +/- 8	114 +/- 16
Extension deficit	0	2 +/- 3		1 +/- 3

- ◆ Pain score at FU 44: (+/-8)

1. Mobilisation under anaesthesia

WHEN ?

Within 2 weeks: Fox JL JBJS Am 1981

After 3 weeks: Esler CN JBJS Br 1999

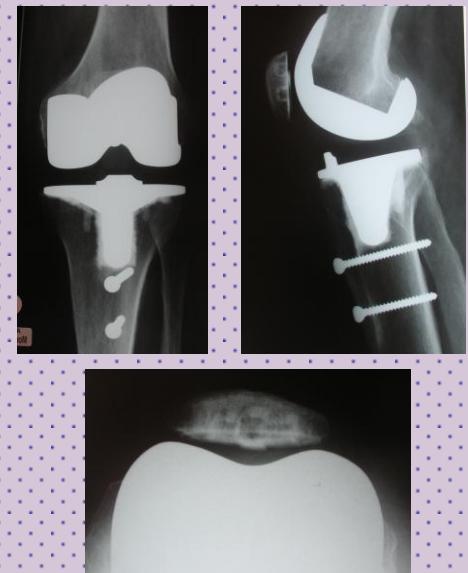

Within 3 weeks: Daluga J J Arthroplasty 1991

No consensus in literature

For us, if there is a good ROM before TKA and completed wound healing is achieved and if we observed no progression or regression we recommend MUA within 10-90 days period.

1. Mobilisation under anaesthesia

How ?

Xrays control +++

1. Mobilisation under anaesthesia

How ?

2. Results of Arthroscopic Release

- ◆ N= 3
- ◆ No retinaculum release

cases	Preop ROM	Final FU	Pain score
Case 1	0/0/70	0/0/125	45
Case 2	0/0/75	0/0/120	40
Case 3	0/5/45	0/0/120	30

2. Arthroscopic release

Technique

How ?

- o Tourniquet, Pump, Shaver, Smillie-like
- o 4 approaches
- o Medial and Lateral Retinaculum releases
- o PCL release ?
- o Complementary Mobilisation
- o To close carefully, Drainage ?

2. Arthroscopic release

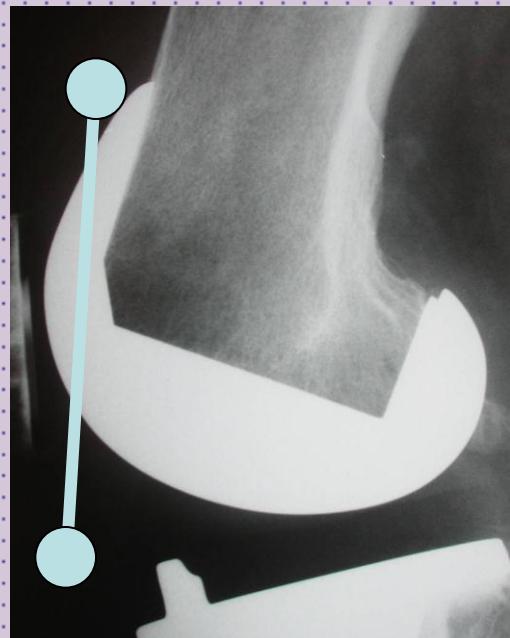

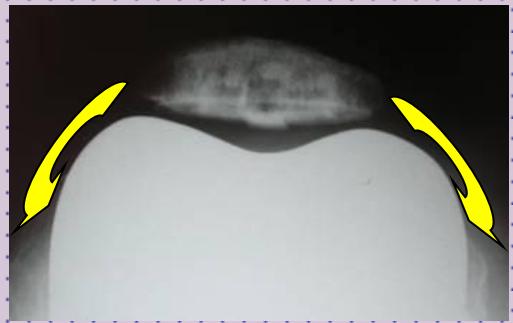

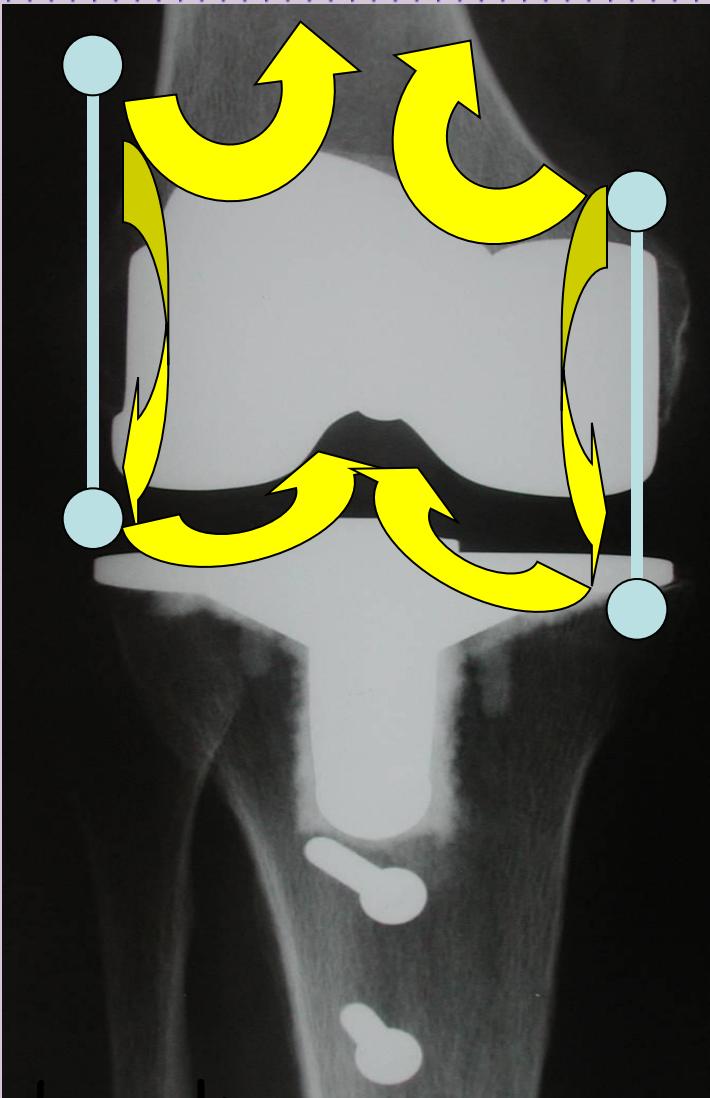

Technique

- Mirror effect

P.
Burdin

- Prosthesis
 - Instrument breakage

2. Arthroscopic release

Post operative cares

- o Post-operative pain control (femoral nerve)
- o Posture or CPM
- o Avoid excessive doses of LMWH
- o Rehabilitation +++

2. Arthroscopic release

Non prosthesis dependant (D Dejour, P Burdin, SFA 2003)

- o Ries MD 2000 Corr N=6
 - o Babis GC 2001 JBJS Am N=7
 - o SoFCOT 2001 RCO N=31
 - o Christiensen CP 2002 J Arthroplasty N=11
 - o SFA 2003 Perspectives... N=42

o Diduch 1998, Mariani 1997, Markel 1996, Bae 1995, Johnson 1990, Parisien 1988

o Williams RI 1996 Corr PCL resection: arthro

2. Arthroscopic release

Our Results (n:3)

- ❖ ROM: Flexion + 30°
Extension + 5°
- ❖ No severe complication

2. Arthroscopic release

Indications

- ❖ Non Prosthesis dependant
- ❖ Technically difficult
- ❖ No ... complication
- ❖ Incomplete improvement
- ❖ Period: D45...D90D180 (except if PCL section)

3. Open Arthrolysis

- ◆ Previous scars: one or two approaches
- ◆ Supra patellar poach and Gutters
- ◆ Removal of tibial insert
 - Allows to reach posterior capsule or retroL arthrotomies
 - Facilitates patellar eversion and management of patellar complications
 - Thinner tibial insert (?? Babis 2001 JBJS Am)

3. Results of open arthrolysis

- ◆ N= 5
- ◆ Retinaculum release +++

	Gesture	Preop ROM	ROM at FU	Pain Score
Case 1	Arthrolysis	0/0/70	0/10/70	45
Case 2	Arhtrolysis	0/0/90	0/0/90	45
Case 3	Arhtrolysis	0/0/40	0/0/115	40
Case 4	Arthrolysis + clunck	0/0/60	0/0/130	50
Case 5	Arthrolysis + clunck	0/0/70	0/0/130	40

4. Results of component revision

- ◆ N= 2
- ◆ Arthrolysis + ----

	Gestures	Preop ROM	At FU	Pain Score
Case 9	+ patellar component removal	0/0/70	0/0/120	50
Case 10	+ Revision of Tibial component + clunck	0/15/70	0/0/120	50

4. Component revision

Prosthesis dependant

- o Extension deficit (Incomplete posterior capsule release and osteophytes excluded)

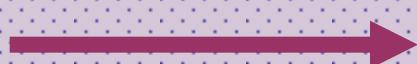

tightened Extension Gap

- ⊕ Improper distal femoral cut
- ⊕ Too thick tibial component

4. Component revision

Prosthesis dependant

- o Flexion deficit (Incomplete posterior capsule release and osteophytes excluded, excessive tightness of PCL)

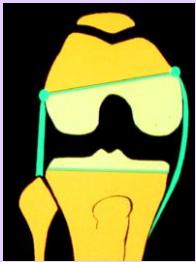

Tightened Flexion gap

Tightened Anterior gap

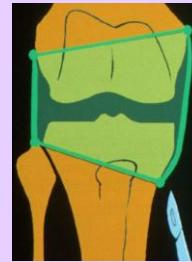

Patellar problems

Tibio-femoral
gap in flexion

Tibio-femoral
gap in extension

Femoral GAP

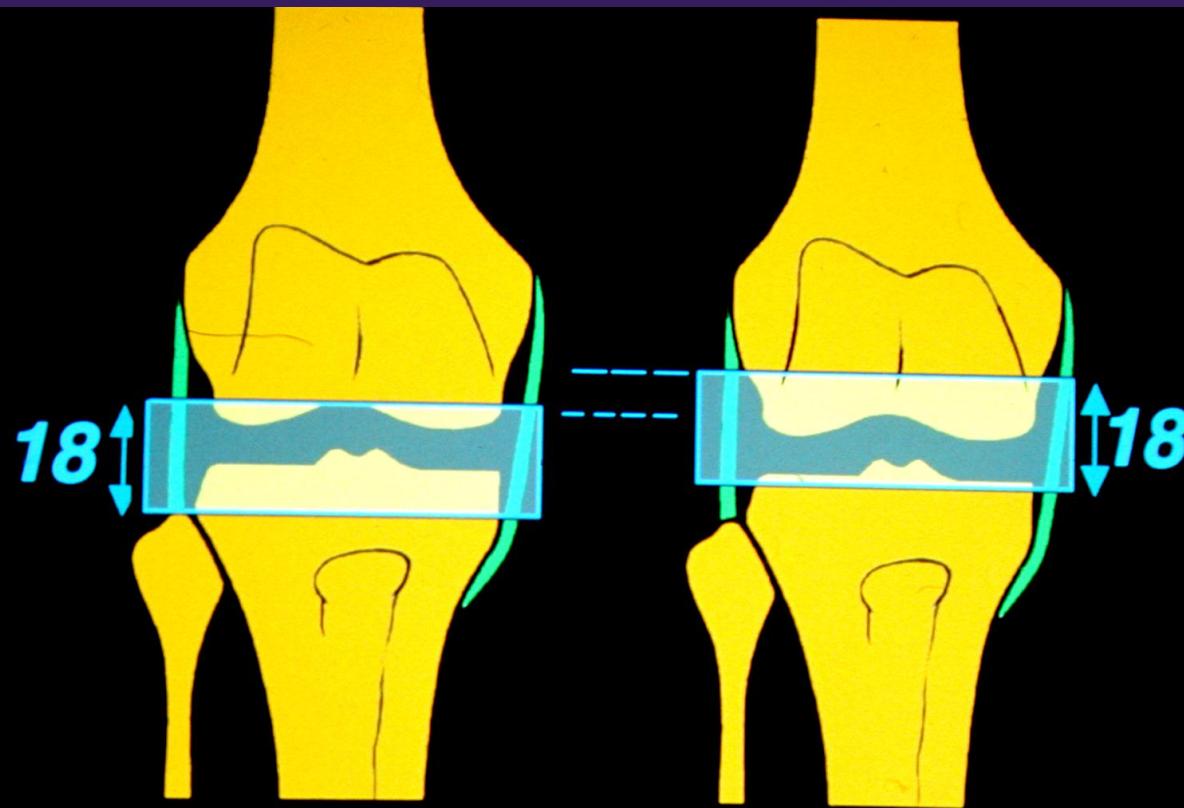

Femoral GAP

Tibial GAP

Tibial GAP

Prosthetic joint line

“Influence of the height of the joint space on the three-dimensional kinematics of total knee prostheses and behavior of the lateral collateral ligaments:
an in vitro study””

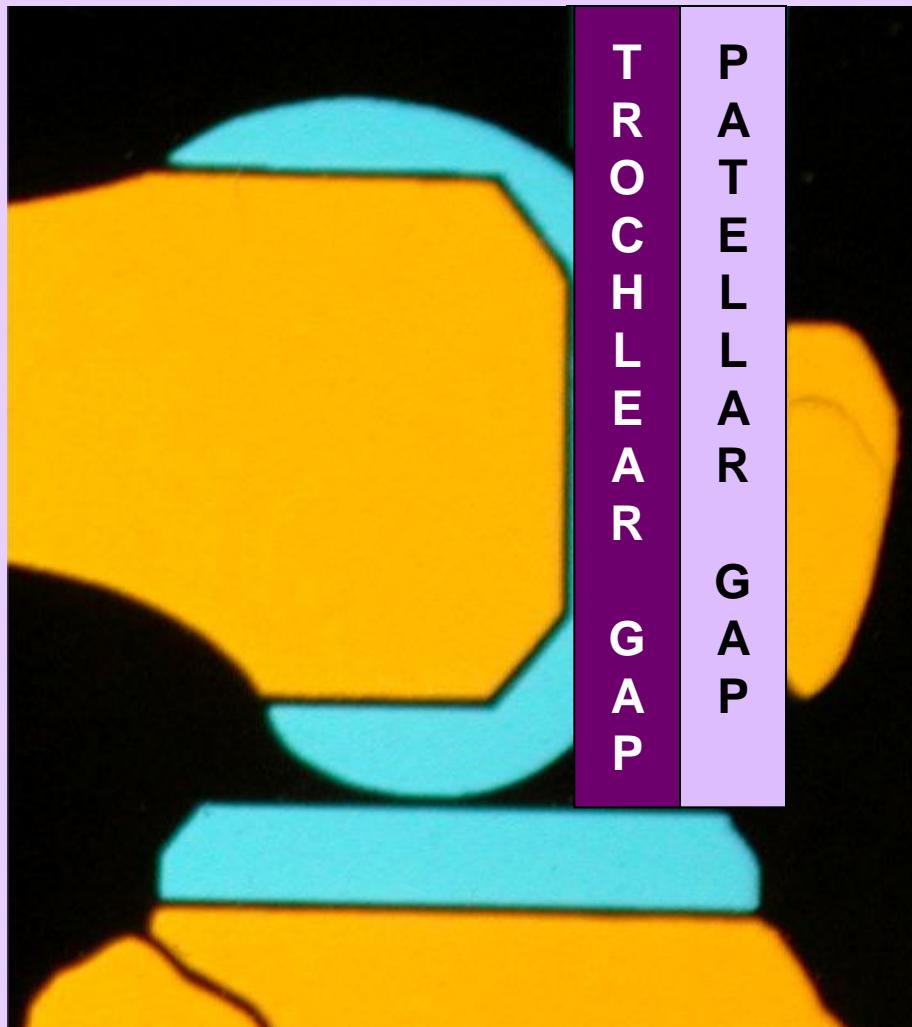

4. Component revision

- ◆ Lack of Flexion

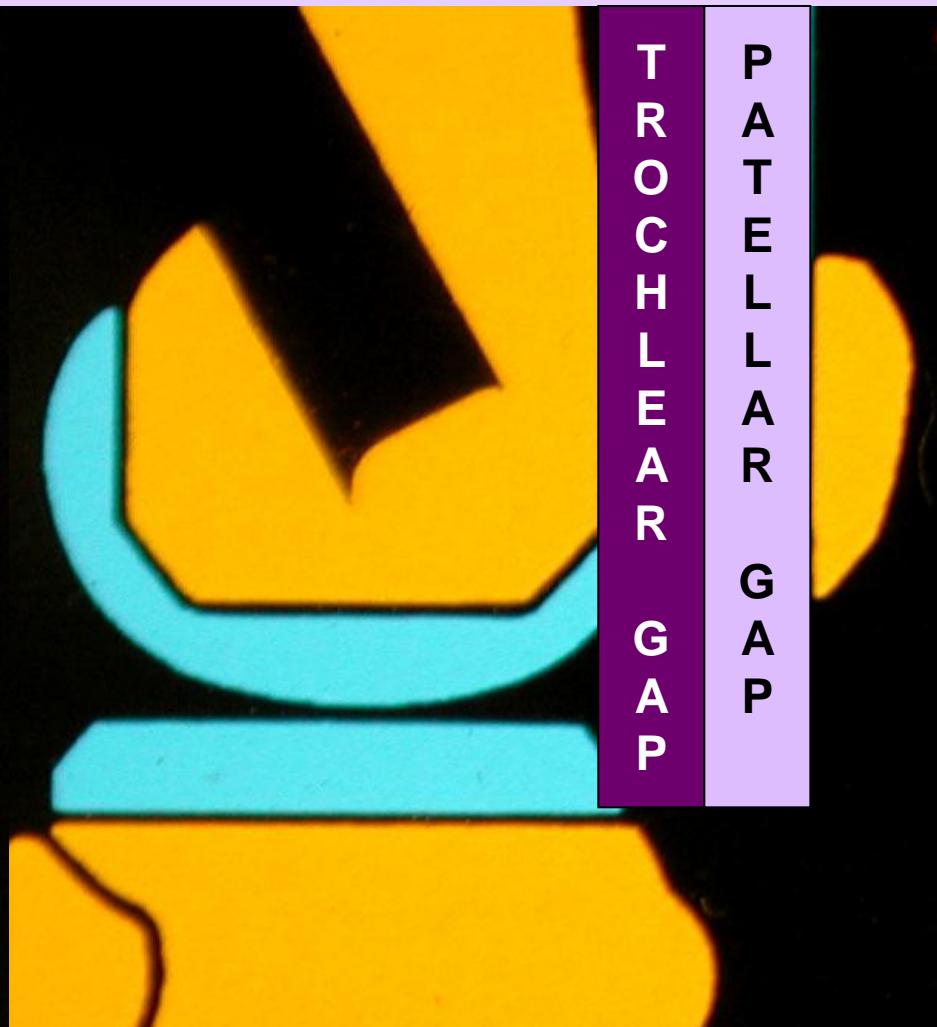

- tightened Flexion gap
- tightened anterior gap

“Anterior gap” described by C. Vielpeau and P. Rivat maitrise orthopedique

Anterior Gap in flexion

Anterior Gap in extension

4. Component revision

◆ Flexion deficit

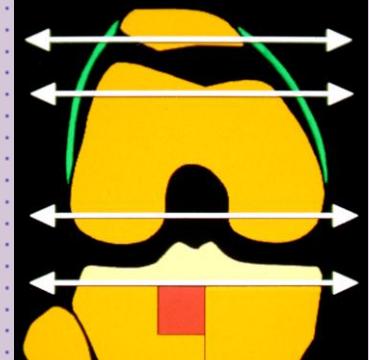

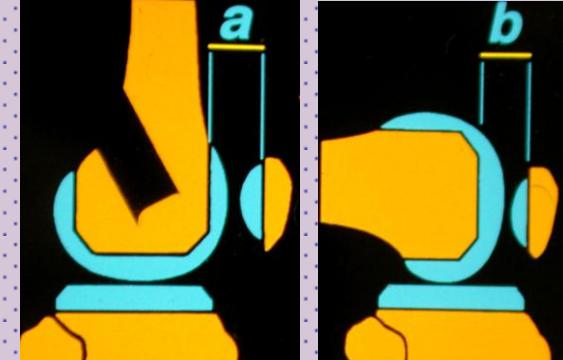

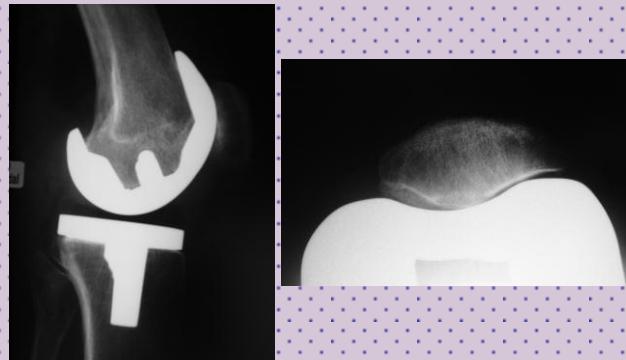

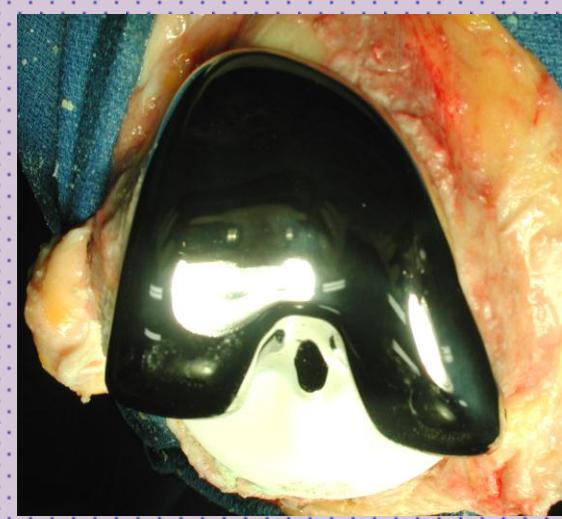

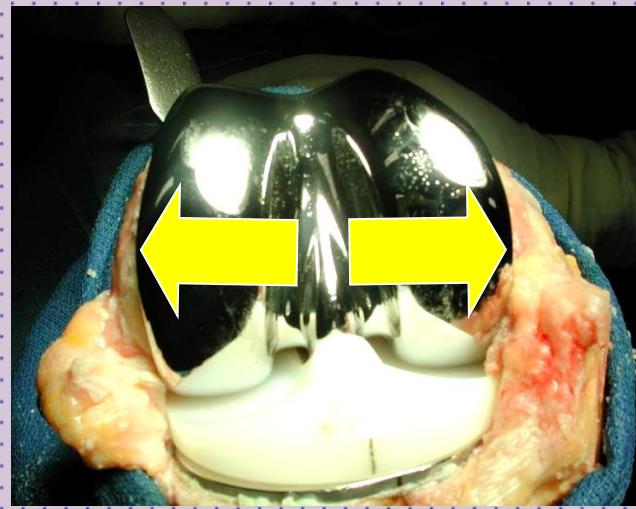

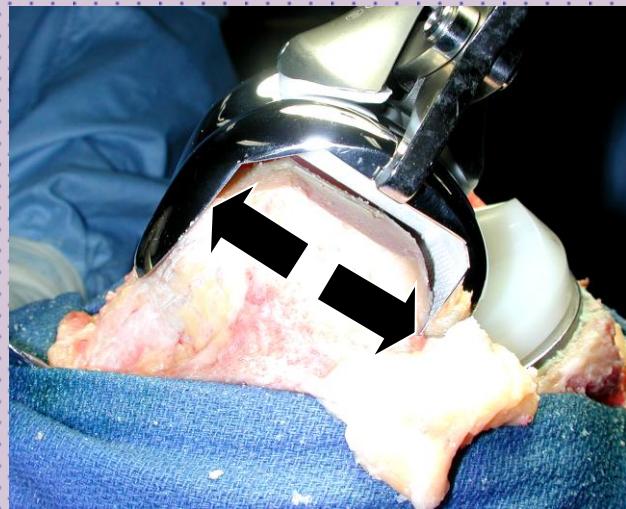

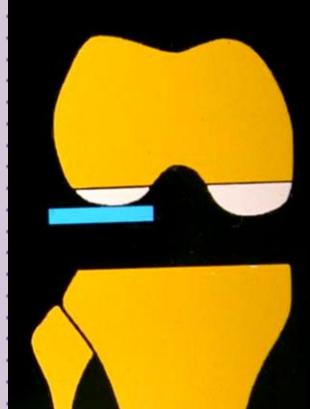

- tightened flexion gap
- tightened anterior gap
- Patellar problems (55%)

- * Patella infera
- * Too thick patella
- * Too proeminent femoral component
- * Unsurfaced Patella ??
- * Lateralized patellar component
- * Patellar tilt due to femoral component malrotation

Good prognostic factor for revision of stiff knee

Bonnin M, Deschamps, Neyret Ph and al RCO 2000

4. Component revision

Conclusion

◆ Non Prostheses dependant
